Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX  
XX Screening drugs for treatment of prostate cancer - uses prostate specific antigen expressing cells.  
XX  
XX Disclosure; Page 25-28; 4pp; English.  
XX  
XX The sequence is that of the non-coding region of human glandular kallikrein-1 (hKlX2) which contains promoter and enhancer active regions. This transcription initiation regulatory region can be used as part of a method for screening drugs for the treatment of prostate cancer employing prostate specific antigen (PSA) expressing cells comprising an expression construct which comprises a transcriptional initiation region of the PSA enhancer, a promoter and a gene whose expression product provides a detectable signal, where the gene is under the transcriptional control of the initiation region, comprises: (a) combining the PSA expressing cells with a candidate drug in the presence of an androgen for sufficient time for detectable expression of the gene, and (b) detecting the level of expression of the gene as compared to the level of expression in the absence of the candidate drug. The method can be used to evaluate the potential of a compound as a therapeutic agent for the treatment of prostate cancer. Particularly, anti-androgenic activity can be evaluated as indicative of therapeutic effects for prostate cancer, although any compound which modifies the expression of a prostate-specific gene may be considered a candidate compound. (Updated on 25-MAR-2003 to correct PR field.)

XX PS Example 6; Page 44-48; 50pp; English.  
XX CC This is the nucleotide sequence of the promoter/enhancer region of the  
XX CC human glandular kallikrein gene (hGKL or hKLK2, encoding the hK2  
XX CC protein). hKLK2 is a member of the kallikrein family, as is the prostate-  
XX CC specific antigen (PSA), a chymotrypsin like protein that is synthesized  
XX CC exclusively by normal, hyperplastic, and malignant prostatic epithelia.  
XX CC This tissue specific nature of PSA makes it an excellent biomarker for  
XX CC identifying benign prostatic hyperplasia (BPH) and prostatic carcinoma  
XX CC (CaP). Elevated levels of PSA are indicative of BPH or CaP. Like PSA,

CC hLK2 is expressed exclusively in the prostate and is up regulated by  
CC androgens, primarily by transcription activation. The proteins also  
CC exhibit a high degree of amino acid sequence identity and contain similar  
CC regulatory elements. The characterisation of genes whose expression is  
CC limited to the prostate allows the development of screening methods which  
CC can identify substances capable of specifically altering the expression  
CC of prostate-specific genes

PT Adenovirus vectors comprising cell-status specific response elements  
PT useful in gene therapy protocols for the treatment of cancers.

XX PS Disclosure; Fig 6A-H; 79pp; English.

XX CC The present sequence comprises a transcriptional regulatory element (TRE) from a human glandular kallikrein gene. The TRE is used to produce an adenoviral vector of the invention. The specification describes an adenovirus vector which comprises an adenovirus gene under transcriptional control of a cell status specific TRE. The TRE is preferably one that is essential for adenoviral propagation. The adenovirus vectors may be used for the treatment of a range of tumours such as lung, stomach, breast, colon and rectum, and uterine and cervix cancers

XX  
XX New adenoviral vector for selective targeting of cancer cells, comprises  
PT an adenovirus gene under transcriptional control of a target cell-  
PT specific transcriptional regulatory element and an E3 sequence.  
XX  
XX Disclosure; Fig 24; 138pp; English.  
XX  
CC The specification describes an adenoviral vector which comprises an  
CC adenoviral gene under the transcriptional control of a target cell-  
CC specific transcriptional regulatory element (TRE) and an E3 sequence. The  
CC vectors are useful for exerting selective cytotoxicity and/or suppressing  
CC cell growth (including tumour growth). This is especially useful in  
CC treating cancer in which targeted cell killing is desirable. This is also  
CC useful for targeted cytotoxic effects in other, non-tumour cells, when  
CC selective destruction and/or suppression of these cells is desirable. The  
CC vectors can also be useful for detecting the presence of cells which  
CC permit function of a target cell-specific TRE in, for example, an  
CC appropriate biological (such as clinical) sample. The adenovirus  
CC vector(s) can optionally selectively produce one or more proteins of  
CC interest in a target cell by using a heterologous, i.e., non-adenoviral,  
CC TRE. The present sequence represents a human glandular kallikrein TRE,  
CC which is used in the course of the invention

PT		Replication-competent adenoviral vector, useful e.g. for killing cancer
PT		cells, contains two genes linked by internal ribosome entry site and
PT		controlled by target-specific regulator.
XX		
PS		Example; Page 106-112; 148pp; English.
XX		
CC		The sequences given in AAH43607-22 represent sequences which may used in
CC		the replication-competent adenoviral vector (A) of the invention. The
CC		vector contains two genes (G1, G2) that are co-transcribed as a single
CC		mRNA and under control of a heterologous, target cell-specific
CC		transcriptional regulatory element (TRE). G2 has a mutation in, or
CC		deletion of, its endogenous promoter and is controlled from an internal
CC		ribosome entry site (IRES). (A) has greater specificity for a target cell
CC		than a similar vector in which TRE is operably linked to a gene and which
CC		lacks an IRES. (A) are used to modify the genotype of target cells, host
CC		optionally in vitro with subsequent return of altered cells to the host
CC		and where G2 is a cytotoxic gene, to confer selective cyto-toxicity to
CC		target cells, especially for killing cancer cells. Also (A) are used for
CC		diagnosis and monitoring, e.g. detection of bladder cancer cells. The
CC		target cell-specific TRE ensures that (A) has better targeting
CC		specificity, with minimal replication in non-target cells, so a runaway
CC		infection is prevented but replication of adenoviral proteins in target
CC		cells activates and/or stimulates the immune response against target
CC		cells producing such proteins. The use of an IRES (rather than two
CC		identical control elements) eliminates the risk of homologous
CC		recombination and may provide enough extra space for an additional
CC		(therapeutic) gene

XX  
XX This sequence is a human glandular kallikrein-TRE coding sequence used in  
CC the scope of the invention. The invention relates to a method for the  
CC suppression of tumour growth comprising the administration of: (a) a  
CC target cell-specific adenovirus vector comprising an adenoviral gene  
CC essential for replication under transcriptional control of a target cell-  
CC specific transcriptional regulatory element (TRE); and (b) at least one  
CC antineoplastic agent; or (c) a course of radiotherapy where the amount of  
CC (a) and/or (b) or (c) is lower than that known to be effective for  
CC suppressing tumour growth when administered alone. The method is used for  
CC suppression of tumour growth for treatment of e.g. bladder cancer,  
CC prostate cancer, liver cancer, breast cancer, colon cancer, melanoma,  
CC ovarian cancer, pancreatic cancer, lung cancer or brain cancer. The  
CC combinations enhance the efficacy of treatment, allowing lower doses to  
CC be administered, reducing toxicity and suffering of the patient

XX New adenovirus vector for transfecting target host cells, comprises an  
XX adenovirus gene under transcriptional control of a cell type-specific  
XX transcriptional response element.

BS Disclosure; Fig 16; 83pp; English.  
XX The present invention relates to adenoviral vectors comprising an  
adenovirus gene under transcriptional control of a cell type-specific  
transcriptional response element (TRE). Example TREs given in the  
specification include human prostate-specific antigen (PSA) TRE, human  
glandular kallikrein (hK1X) TRE, rat probastin (PB) TRE, human  
carcinoembryonic antigen (CEA) TRE, and human mucin-like glycoprotein DF3  
(MUC1) TRE. The modified adenovirus vector is useful as a vehicle for  
introducing new genetic capability, particularly associated with  
cytotoxicity for treating neoplasia. For example, the vector may be used  
in a target cell to suppress tumour growth, or to kill the target cell.  
The vector is particularly useful in gene therapy. The present sequence  
represents a TRE

XX
XX New nucleic acid containing the human glandular kallikrein enhancer -
XX providing increased expression of heterologous sequences in prostatic
XX cells, and related adenoviral vectors for treating prostatic cancer.
XX
XX Claim 1; Page 150-157; 179pp; English.
XX
XX This polynucleotide comprises the promoter/enhancer region of the human
XX glandular kallikrein (hKG-1 or hKLK2) gene. An hKLK2 enhancer, when
XX operably linked to an hKLK2 promoter and a reporter gene, increases
XX transcription of cis-linked sequences in prostatic cells in the presence
XX of androgen at levels 30-100 fold over the level of transcription in the
XX absence of androgen. The hKLK2 enhancer can form part of an hKLK2
XX transcriptional regulatory element (hKLK2-TRE), which in turn can be
XX operably linked to a heterologous polynucleotide to effect
XX transcriptional control of a linked gene. The hKLK2-TRE is useful for
XX enabling the directed expression of a desired gene in these cells. The
XX hKLK2-TRE can be incorporated into a replication-competent adenovirus
XX vector so that the hKLK2-TRE controls expression of at least one
XX adenoviral gene, preferably one that contributes to cytotoxicity. Such
XX vectors are useful for treatment of cancers such as prostate cancer.
XX Methods for conferring selective cytotoxicity on a cell and for screening
XX compounds for the treatment of prostate cancer are claimed
XX
XX Sequence 12047 BP; 3053 A; 2482 C; 2870 G; 3642 T; 0 U; 0 Other;

XX New nucleic acid containing the human glandular kallikrein enhancer -  
PT providing increased expression of heterologous sequences in prostatic  
PT cells, and related adenoviral vectors for treating prostatic cancer.  
XX  
XX Claim 4; Page 168; 179pp; English.  
XX  
XX This polynucleotide comprises nucleotides 7200-8371 of the 5' flanking  
CC region of the human glandular kallikrein (hKUK2) gene (see AAX24755).  
CC This comprises a claimed enhancer region including a putative androgen  
CC response element (ARE). Mutation of this ARE (see AAX24773 and AAX24774)  
CC was shown to affect enhancer function. hKUK2 enhancers of the invention  
CC have been shown to increase the transcription of cis-linked coding  
CC sequences in prostate cells. Methods of using DNA constructs comprising  
CC the enhancers to control transcription of heterologous polynucleotides  
CC are provided. Adenoviral vectors in which one or more genes are under  
CC transcriptional control of a hKUK2 transcription regulatory element are  
CC claimed, and can be used to confer selective cytotoxicity in mammalian  
CC cells for use e.g. in the treatment of prostate cancer

XX  
FS Claim 6; Page 49; 50pp; English.  
XX  
CC This is the nucleotide sequence of the hKLK2 enhancer region contained in  
construct CN390. hKLK2 is a member of the kallikrein family, as is the  
prostate specific antigen (PSA), a chymotrypsin like protein that is  
synthesized exclusively by normal hyperplastic, and malignant prostatic  
epithelia. This tissue specific nature of PSA makes it an excellent  
biomarker for identifying benign prostatic hyperplasia (BPH) and  
prostatic carcinoma (CaP). Elevated levels of PSA are indicative of BPH  
or CaP. Like PSA, hKLK2 is expressed exclusively in the prostate and is  
up regulated by androgens, primarily by transcription activation. The  
proteins also exhibit a high degree of amino acid sequence identity and  
contain similar regulatory elements. The characterisation of genes whose  
expression is limited to the prostate allows the development of screening  
methods which can identify substances capable of specifically altering  
the expression of prostate-specific genes

PT	Isolated nucleic acid for treating subject having or at risk of having
PT	prostate disorder, such as prostate tumor comprises a distal enhancer
PT	element 2.
XX	
XX	Claim 2a; Fig 3; 5lpp; English.
PS	
XX	
CC	This is the nucleotide sequence of distal enhancer element 2 (DEE2), a
CC	novel regulatory element of the human prostate specific antigen (PSA)
CC	gene. In vivo, DEE2 is located in the intergenic region between the PSA
CC	gene and the glandular kallikrein (hk2) gene, from about -5.2 kb to -3.6
CC	kb relative to the transcriptional start site of the hk2 gene on
CC	chromosome 19. The invention provides a nucleic acid construct including
CC	DEE2 operably linked to a nucleic acid sequence encoding a heterologous
CC	protein. Expression vectors, host cells and transgenic mice including the
CC	construct are also provided. A method for producing a transgenic animal
CC	having a phenotype characterised by expression of a transgene in the
CC	prostate involves introducing a transgene including DEE2 into an embryo
CC	of the animal. A method for providing transcription of a nucleic acid
CC	sequence in a prostate cell of an animal involves introducing into the
CC	cell a nucleic acid construct comprising DEE2 operably associated with a
CC	nucleic acid sequence which encodes a product such as a biologically
CC	active polypeptide, a cytotoxic agent, an antisense RNA or a ribozyme.
CC	The invention also provides a method of treating a subject having, or at
CC	risk of, a prostate disorder (e.g. a tumour) by administering a
CC	therapeutically effective amount of a nucleic acid construct including
CC	DEE2

PT providing increased expression of heterologous sequences in prostatic  
PT cells, and related adenoviral vectors for treating prostatic cancer.  
XX Example 7; Page 169; 179pp; English.  
CC This polynucleotide is based on nucleotides 7200-8371 of the 5' flanking  
CC region of the human glandular kallikrein (hKLK2) gene (see AAX24755), but  
CC the putative androgen response element (ARE) of the native sequence (see  
CC AAX24772) has been mutated. This mutation was shown to affect the  
CC enhancer function of this region of the hKLK2 gene. hKLK2 enhancers of  
CC the invention have been shown to increase the transcription of cis-linked  
CC coding sequences in prostate cells. Methods of using DNA constructs  
CC comprising the enhancers to control transcription of heterologous  
CC polynucleotides are provided. Adenoviral vectors in which one or more  
CC genes are under transcriptional control of a hKLK2 transcription  
CC regulatory element are claimed, and can be used to confer selective  
CC cytotoxicity in mammalian cells for use e.g. in the treatment of prostate  
CC cancer

PT Screening for compounds which inhibit prostate cancer using a cell line  
PT containing a marker whose expression is responsive to therapeutically  
PT active compounds.  
XX  
PS Claim 6; Page 50; 50pp; English.  
XX  
CC This is the nucleotide sequence of the hKLK2 enhancer region contained in  
CC construct CN457. hKLK2 is a member of the kallikrein family, as is the  
CC prostate specific antigen (PSA), a chymotrypsin like protein that is  
CC synthesized exclusively by normal, hyperplastic, and malignant prostatic  
CC epithelia. This tissue specific nature of PSA makes it an excellent  
CC biomarker for identifying benign prostatic hyperplasia (BPH) and  
CC prostatic carcinoma (CaP). Elevated levels of PSA are indicative of BPH  
CC or CaP. Like PSA, hKLK2 is expressed exclusively in the prostate and is  
CC up regulated by androgens, primarily by transcription activation. The  
CC proteins also exhibit a high degree of amino acid sequence identity and  
CC contain similar regulatory elements. The characterisation of genes whose  
CC expression is limited to the prostate allows the development of screening  
CC methods which can identify substances capable of specifically altering  
CC the expression of prostate-specific genes

XX New polynucleotide, useful for treating prostatic cancer, comprises  
PT prostate specific chimeric enhancer and proximal promoter sequence.  
PT operably linked to nucleic acid encoding heterologous polypeptide.

XX Claim 17; Page 80; 13pp; English.

XX The present sequence may be used in an invention relating to an isolated  
CC polynucleotide comprising a prostate-specific chimeric enhancer (PSE)  
CC sequence and a proximal promoter sequence operably linked to a nucleic  
CC acid segment that encodes a heterologous polypeptide. The PSE contains an  
CC ARE and specifically activates transcription of the nucleic acid segment  
CC in a mammalian prostate cell. The construct is useful for the treatment  
CC of a prostate disorder or a metastasised prostate cancer, such as  
CC hyperplasia or hyperproliferation of prostate cells. It is also useful  
CC for directing the tissue-specific expression of a heterologous  
CC polypeptide in a human prostate cell. The construct may be administered  
CC by injection, infection, transformation, liposome-mediated transfection,  
CC polybrene-mediated transfection, receptor-mediated uptake or Ca-P04-  
CC mediated transformation

RESULT 3	
AX259951	
LOCUS	AX259951
DEFINITION	Sequence 36 from Patent WO0172341.
ACCESSION	AX259951
VERSION	AX259951.1 GI:16509011
KEYWORDS	synthetic construct
SOURCE	synthetic construct
ORGANISM	artificial sequences.
REFERENCE	1
AUTHORS	Yu, D.C., Chen, Y. and Henderson, D.R.
TITLE	Methods of treating neoplasia with combinations of target cell-specific adenovirus, chemotherapy and radiation
JOURNAL	Patent: WO 0172341-A 36 04-OCT-2001; Calydon, Inc.(US)

RESULT 6
LOCUS BD224259 12047 bp DNA linear PAT 17-JUL-2003
DEFINITION Adenovirus vectors containing cell status-specific response
elements and methods of use thereof.
ACCESSION BD224259
VERSION BD224259.1 GI:33034029
KEYWORDS JP 2002525063-A/5.
SOURCE Homo sapiens (human)
ORGANISM Homo sapiens
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
REFERENCE 1 (bases 1 to 12047)
AUTHORS Yu,D.C. and Henderson,D.R.
TITLE Adenovirus vectors containing cell status-specific response

Direct Submission  
Submitted (24-AUG-2002) Whitehead Institute/MIT Center for Genome  
Research, 320 Charles Street, Cambridge, MA 02141, USA  
On Nov 15, 2000 this sequence version replaced gi:11136831.  
All repeats were identified using RepeatMasker:  
Smit, A.F.A. & Green, P. (1996-1997)  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>  
----- Genome Center

Center: Whitehead Institute/ MIT Center for Genome Research  
Center code: WIBR  
Web site: <http://www-seq.wi.mit.edu>  
Contact: [sequence\\_submissions@genome.wi.mit.edu](mailto:sequence_submissions@genome.wi.mit.edu)  
----- Project Information  
Center project name: L9166  
Center clone name: 795\_B\_6  
----- Summary Statistics  
Sequencing vector: M13; M7815; 31% of reads  
Sequencing vector: Plasmid; n/a; 69% of reads  
Chemistry: Dye-terminator Big Dye; 100% of reads  
Assembly program: Phrap; version 0.960731  
Consensus quality: 210748 bases at least Q40  
Consensus quality: 213655 bases at least Q30  
Consensus quality: 215058 bases at least Q20  
Insert size: 19400; agarose-fp  
Insert size: 216246; sum-of-contigs  
Quality coverage: 11.9 in Q20 bases; agarose-fp  
Quality coverage: 10.7 in Q20.  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 12 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.  
\* 1 8149: contig of 8149 bp in length  
\* 8150 8249: gap of 100 bp  
\* 8250 9592: contig of 1343 bp in length  
\* 9593 9592: gap of 100 bp  
\* 9693 10733: contig of 1041 bp in length  
\* 10734 10833: gap of 100 bp  
\* 10834 13519: contig of 2686 bp in length  
\* 13520 13619: gap of 100 bp  
\* 13620 17510: contig of 3891 bp in length  
\* 17511 17510: gap of 100 bp  
\* 17511 24602: contig of 6992 bp in length  
\* 24603 24702: gap of 100 bp  
\* 24703 35434: contig of 10732 bp in length  
\* 35435 35534: gap of 100 bp  
\* 35535 124474: contig of 88940 bp in length  
\* 124475 124574: gap of 100 bp  
\* 124575 134664: contig of 10090 bp in length  
\* 134665 134765: gap of 100 bp  
\* 134765 162343: contig of 27579 bp in length  
\* 162344 162444: gap of 100 bp  
\* 162444 208917: contig of 46474 bp in length  
\* 208918 217346: contig of 100 bp  
\* 209018 217346: contig of 8329 bp in length.

RESULT 10  
AF243527 DNA linear PRI 21-NOV-2000  
LOCUS Homo sapiens serine protease gene cluster, complete sequence.  
DEFINITION AP243527  
ACCESSION AP243527  
VERSION GI:11244757  
KEYWORDS  
SOURCE Homo sapiens (human)  
ORGANISM Homo sapiens  
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;  
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.  
REFERENCE 1 (bases 1 to 230000)  
AUTHORS Gan,L., Lee,I., Smith,R., Argonza-Barrett,R., Lei,H., McCuaig,J.,  
Moss,P., Pieper,B. and Wang,K.  
TITLE Sequencing and expression analysis of the serine protease gene  
cluster located in chromosome 19q13 region  
JOURNAL Gene 257 (1), 119-130 (2000)  
MEDLINE 20510030  
PubMed 11054574  
REFERENCE 2 (bases 1 to 230000)  
AUTHORS Gan,L., Lee,I., Smith,R., Argonza-Barrett,R., Lei,H., McCuaig,J.,  
Moss,P., Pieper,B. and Wang,K.  
TITLE Direct Submission  
JOURNAL Submitted (09-MAR-2000) Chiroscience R & D Inc., 1631 220th St. SE,  
Bothell, WA 98021, USA
